LAB TASK- 03

Binary Search Tree

Complete the following Binary Search Tree based on the following functions:

Struct node{

```
int key;
struct node *left, *right;
}
```

1. Create a new function newnode to assign value of a node
   Void newnode(int val) { }

2. Create an insert function to insert a node to the Binary search tree.
   Void insert(int val){ }

3. Create a function to search for the minimum value in the BST using the following function:
   int *minvalue(node *root) { }

4. Create an insert function to delete a node from the Binary search tree.
   void deletenode(int val){ }

5. Write down the three traversal functions that will be used in the Binary Search Tree.
   Void inorder(node *root){ }
   Void preorder(node *root){ }
   Void postorder(node *root){ }
