The Government is interested to create a Directory for peoples of Bangladesh. As Bangladesh is a large country, the government has decided to create ***NationalDirectory*** and ***LocalDirectory*** and ***Profession*** seperately. Here class ***Profession*** will inherit information from class ***LocalDirectory***, ***NationalDirectory*** and ***Directory***. Your task is to write a program in C++ using OOP concept for Government of Bangladesh. The government has already mentioned member data and member functions for each class with function's return type. See the table below:

Class	Member data (Protected)	Member function/method (Public)

Directory	***string personName;***
	string dateOfBirth;
		string setPersonInfo(string pn, string db)
		{
		//complete the method
		}
		void displayInfo()
		{
		//complete the method
		}

NationalDirectory	***int personAge;***
	string personCity;
		int setPersonAge(int age)
		{
		//complete the method
		}
		string setPersonCity(string city)
		{
		//complete the method
		}
		void displayNationalInfo()
		{
		//complete the method
		}

LocalDirectory	***string personAddress;***
	string personTelNo;
	string personLocalArea;
	double zipCode;
		string setPersonAddress(string address)
		{
		//complete the method
		}
		string setPersonTelNo(string telNo)
		{
		//complete the method
		}
		string setPersonLocalArea(string Larea)
		{
		//complete the method
		}
		double setPersonZipcode(double zc)

		{
		//complete the method
		}
		void displayLocalInfo()
		{
		//complete the method
		}

Profession	***string personProfession;***
	string personInstitution;
	string personGrade;
	double personSalary;
		string setPersonProfession(string prof)
		{
		//complete the method
		}
		string setPersonInstitution(string inst)
		{
		//complete the method
		}
		string setPersonGrade(string Pgrade)
		{
		//complete the method
		}
		double setPersonSalary(double s)
		{
		//complete the method
		}
		void DisplayProfession()
		{
		//complete the method
		}

You are not allowed to use any constructor in the program.

You are not allowed to use any *cin*.

Once you finish the classes, start writing the ***main()***. In the ***main()***, create an object named as ***person*** with the reference of ***Profession*** Class. Access each method mentioned in the above table to generate the following output.

Name = S Ahmed
DoB = 24/07/1968
Age = 45
City = Dhaka
Address = House-3,Road 18
Tel = 017542140
Local Area = Gulshan 2
Zip code = 1211
Profession = Lecturer
Institution = AIUB
Grade = Band-6
Salary = 50000

Good Luck!!!!!
